El Niño/Southern Oscillation

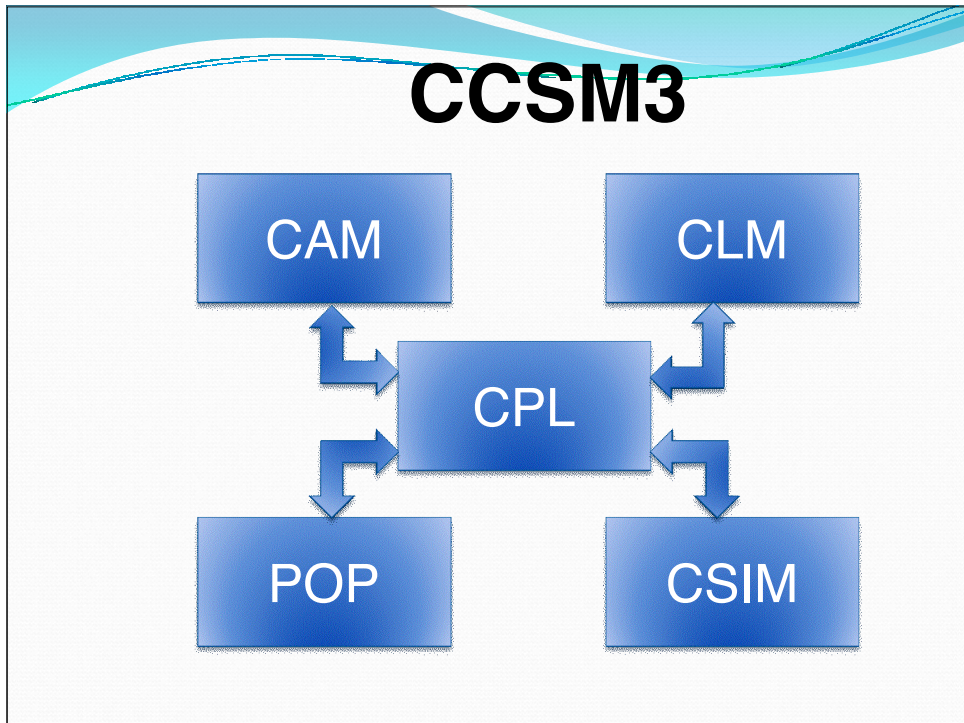

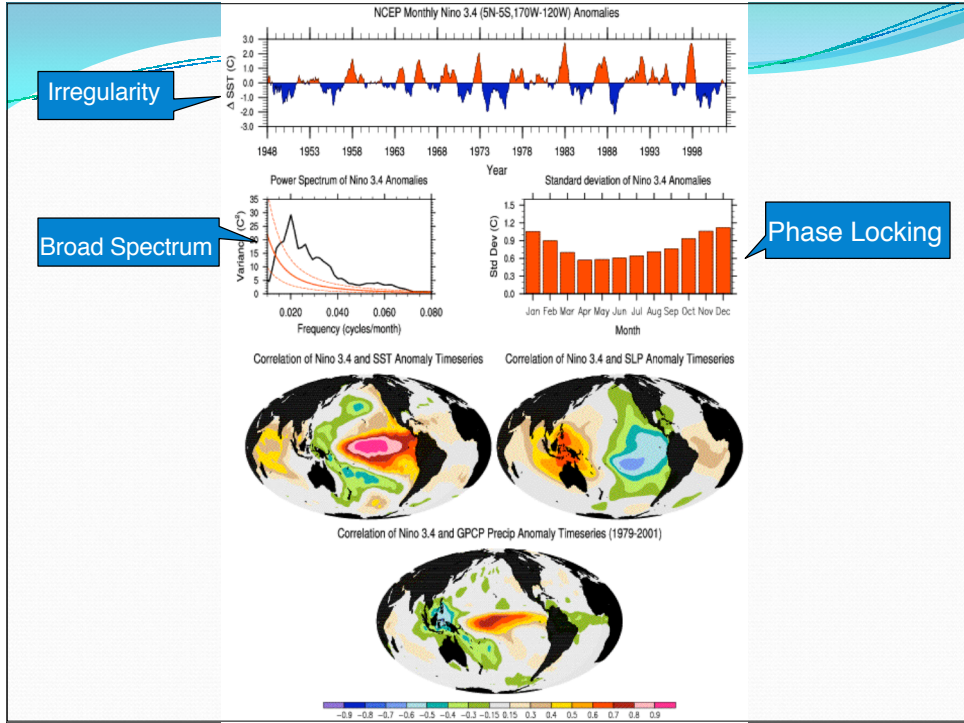

December - February Normal Conditions

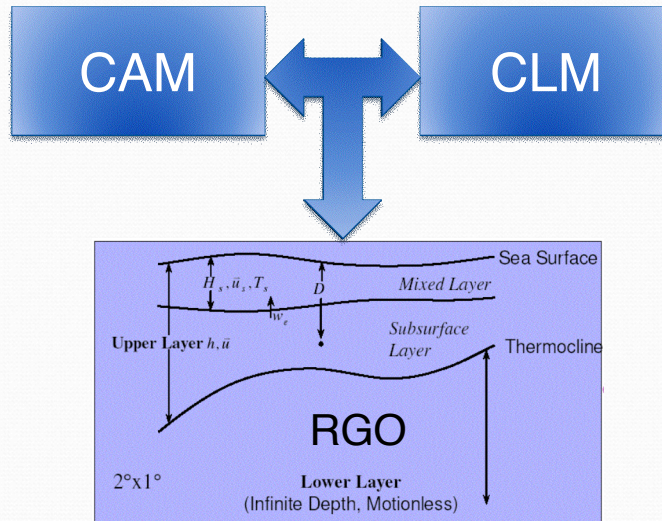

El Niño and the Southern Oscillation: the major mode of interannual variation in the tropical climate

December - February El Niño Conditions

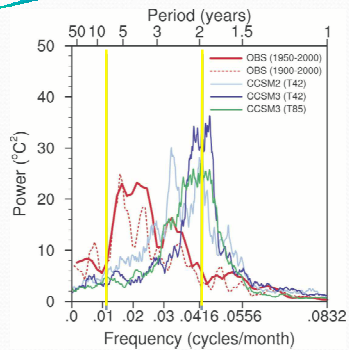

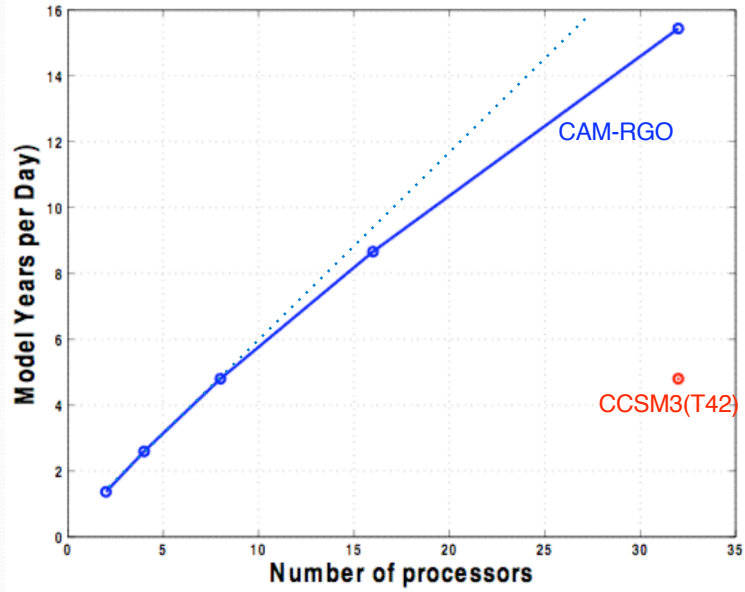

CAM-RGO

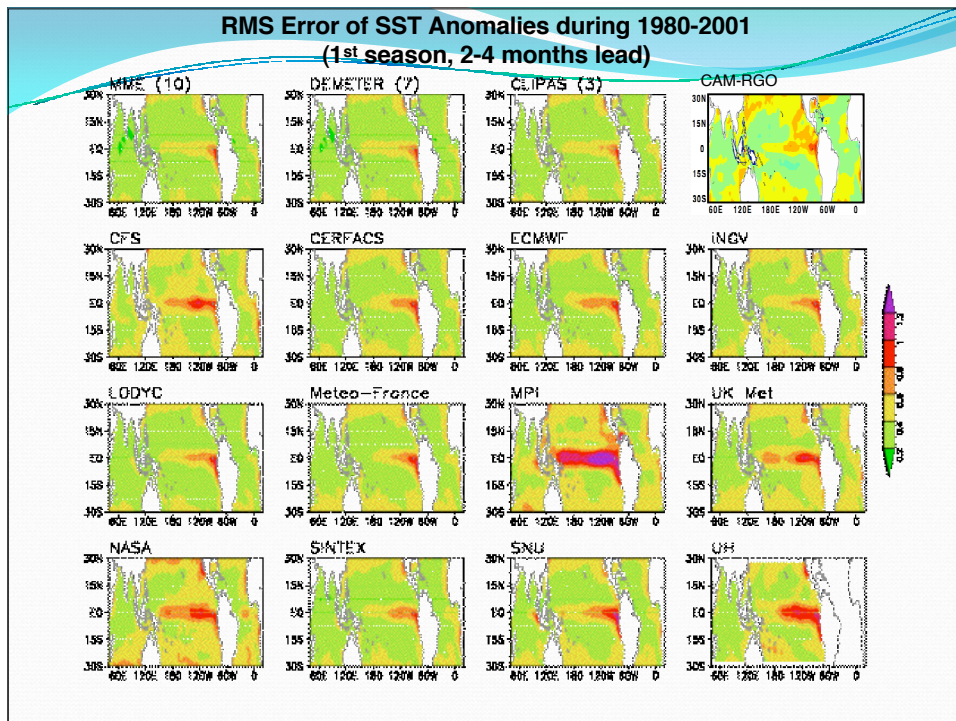

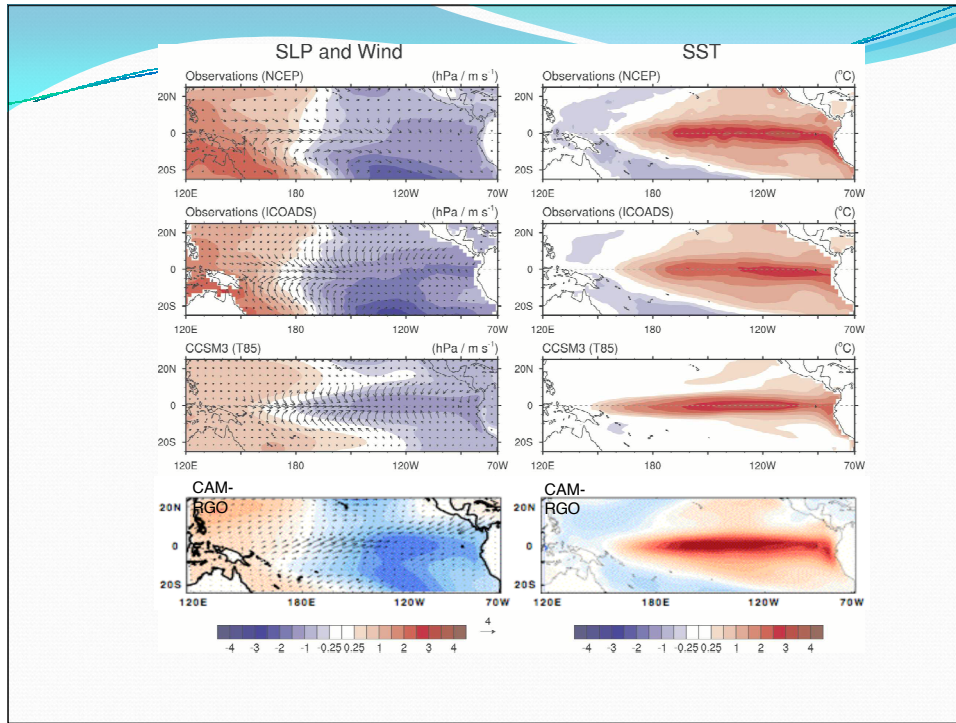

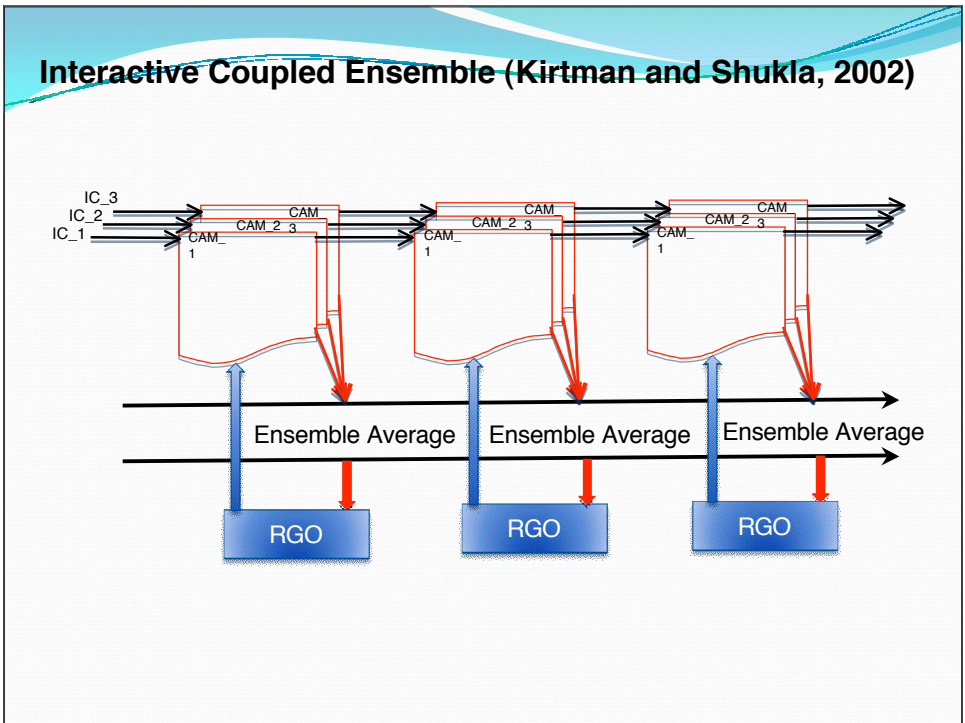

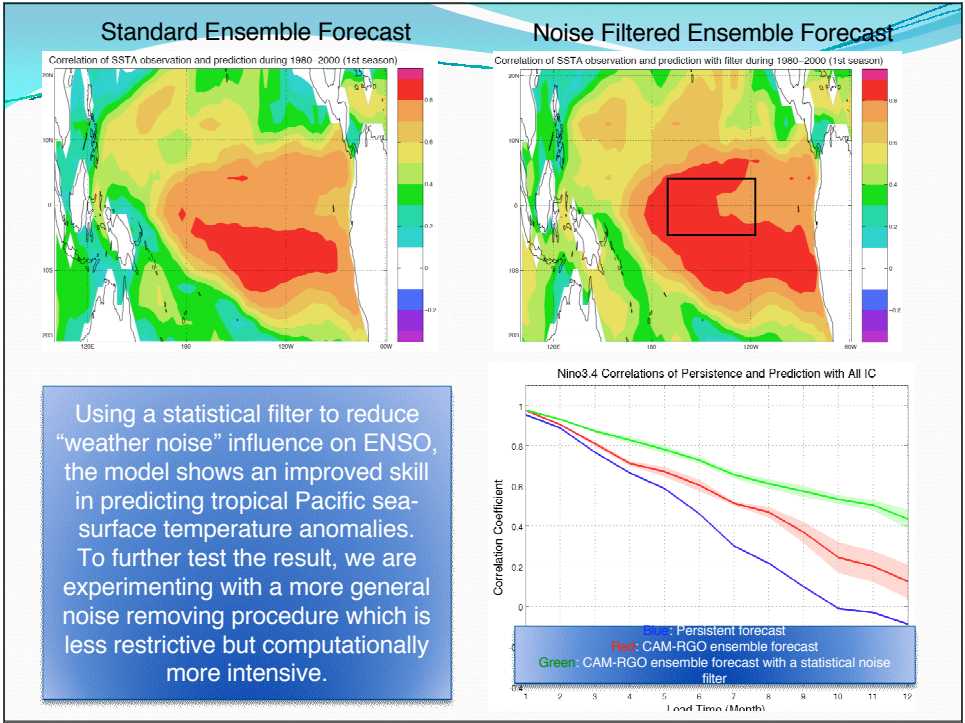

CAM3

- **Community Atmospheric Model version 3**
 - Developed at NCAR with substantial DOE input, both scientific and software.
- **The atmosphere model for CCSM, the coupled climate system model.**
 - Also the most timing consuming part of CCSM.
 - Widely used by both American and foreign scientists for climate research.
 - For example, Carbon, bio-geochemistry models are built upon (integrated with) CAM3.
 - IPCC predictions use CAM3 (in part)
 - About 230,000 lines codes in Fortran 90.
- **1D Decomposition, runs up to 128 processors at T85 resolution (150Km)**
- **2D Decomposition, runs up to 1680 processors at 0.5 deg (60Km) resolution.**

CAM-RGO Performance on Hydra

Concluding Remarks

- A new climate modeling tool that can be very useful for ENSO study and ENSO prediction
- A new strategy for enhancing signal-to-noise ratio that may lead to improvement for seasonal climate forecast
